

Sohaib Sohail

Senior Platform Engineer

✉ sscontactenquiries@gmail.com ☎ 07737127829 📍 Preston, UK 🔗 LinkedIn 🐙 GitHub 📝 Tech Blog

👤 Profile

Senior Platform Engineer with 5+ years building resilient, secure cloud infrastructure and automated delivery pipelines across AWS, Azure, and GCP. Experienced in Terraform at scale across multi-brand, multi-region estates, Kubernetes orchestration, CI/CD architecture, secrets management, and DevSecOps integration. Currently running production platform infrastructure for a multi-tenant SaaS product, owning multi-region failover, observability, adversarial security testing, and per-tenant cost governance for AI workloads on AWS Bedrock. Proven track record deploying Landing Zones, multi-region infrastructure, low-latency compute, and production platforms for financial services clients including NatWest, Barclays, and Deutsche Bank.

🧠 Skills

Cloud Platforms: AWS: ECS, EKS, Lambda, API Gateway, S3, Route 53, CloudFront, Bedrock | Azure: AI Foundry, Functions, APIM, Container Apps, Cosmos DB, Front Door, Entra ID, ACR | GCP: Vertex AI, Cloud Run, Cloud Armor

Infrastructure as Code: Terraform, Terraform Cloud (TFE) Workspaces, State Migration, Ansible, CloudFormation, Modular Multi Region IaC

Containerisation and Orchestration: Docker, Kubernetes, Helm, ECS Fargate, Container Apps, Image Optimisation, Private Endpoints

DevOps and CI/CD: GitHub Actions, Azure DevOps, GitLab CI, Jenkins, Drone CI, GitOps, JFrog Artifactory, HashiCorp Vault, OIDC Federation

DevSecOps and Observability: Checkov, TFLint, Terratest, Anchore, SonarQube, Datadog, CloudWatch, Azure Monitor, Application Insights, Log Analytics, Pingdom, WAF, OWASP LLM Top 10, PyRIT, Promptfoo

AI Platform (LLMOps): AWS Bedrock, Bedrock Guardrails, Azure AI Foundry, Azure OpenAI, APIM Token Governance, Quota and Rate Limit Management, Prompt Caching, LLM Evaluation Harnesses

Programming and Scripting: Python, Ruby, Azure SDK (Python), Azure CLI, AWS CLI, Bash, SQL, PowerShell

📁 Professional Experience

Senior Platform Engineer, Veracross

04/2026 – Present | UK, Remote

- Owned **Terraform** delivery across a multi-brand **AWS** estate held in separate repositories and **GitHub** organisations, managing Terraform plans and apply with **each PR**.
- Led decommission of the **AWS China** region, auditing all 160 organisation repositories to scope the work accurately, then sequencing **8 PRs** across three repositories against live **terraform plan -destroy** output.
- Rolled out **Terraform linting** and formatting standards (**.tflint.hcl**, **terraform fmt**, **CI enforcement**) across three Terraform repositories via 9 PRs, standardising code quality on a previously unlinted estate.
- Scoped teardown of **11 site-to-site VPN connections** across two regions, identifying a shared **virtual private gateway** dependency and ring-fencing live transit gateway tunnels before any destroy was run.
- Planned consolidation of four **Terraform Cloud** workspaces into a single global workspace covering **RDS and Route 53**, with a state migration and zero-diff reconciliation sequence.
- Engineered **multi-region, fault-tolerant infrastructure** with cross-region failover and prompt-cache namespacing, bridging the **AI and DevOps** teams to drive automation across the estate.
- Implemented **AWS Bedrock Guardrails** via **Terraform** across three regions to **block prompt injection and jailbreaking**. Worked with CyberSOC and infosec on a **64-prompt adversarial suite (OWASP LLM Top 10, Microsoft PyRIT, Promptfoo)**, taking it from 56/64 to 64/64 after a Terraform remediation.
- Diagnosed a production incident where guardrail false positives were blocking legitimate user traffic, proving through 27 test cases and 45 positive controls that **filter strength** rather than attack detection was the cause, and that the detector was non-deterministic across identical runs (83% vs 94%). Shipped a single config change across all **regions**, restoring 100% correct results.
- Established **Datadog observability** with an 8-panel dashboard (**health, latency, TTFT, token usage, cache efficiency, quota headroom**) and monitors for **TPM quota**, throttling, and server errors routed to **Slack**, plus **Pingdom** endpoint monitoring for production health checks.
- Owned capacity and cost governance for the platform: **managed rate-limit quotas**, enforced per-tenant token budgets, and set threshold alerting against a **6M TPM / 10K RPM** regional ceiling to keep headroom visible before throttling.
- Built a centralised **observations** layer and supporting **Ruby APIs** capturing events, guardrail interventions, and usage metrics across tenants and agents, feeding **Datadog** audits and **Slack** alarms.

- Shipped an **LLM-as-a-judge** evaluation harness running in CI on every PR, with severity-gated verdicts and per-run HTML dashboards, catching quality and **safety regressions** before release.

Senior Cloud & AI Engineer, London Stock Exchange Group (LSEG)

09/2025 – 01/2026 | UK, Remote

- Established **CI/CD pipelines** in **GitLab** for infrastructure and application deployments across **LSEG's** enterprise **AI platform** (200+ projects), integrating **HashiCorp Vault** for secrets management and **JFrog Artifactory** for artifact storage and versioning.
- Built **Terraform modules** with **Azure SDK (Python)** to deploy multi-region infrastructure, designing a modular architecture with **YAML**-based configuration supporting multiple resource families, SKUs, and sequential deployment dependencies.
- Deployed foundation infrastructure for an **MCP** server (VNet, private endpoints, container registry, container image) supporting a US team's production workload, resolving complex networking constraints with **Microsoft's AI Product team**. Delivered ahead of deadline and demoed to the **CTO** of **LSEG**.
- Designed an automated quota discovery and capacity weighting pipeline (**Python, Azure CLI**) generating **Terraform variables**, reducing deployment time by 93% (30 min to 2 min) and eliminating manual provisioning failures.
- Monitored platform health via daily **Python** cron-jobs detecting unauthorised deployments, tracking **capacity usage**, and diagnosing **rate-limiting** and **API connectivity** issues, with weekly version and expiry tracking to keep 50+ deployments current.
- Managed **APIM** integrations for secure **API** access including **rate-limiting**, **token governance**, and **platform-wide authentication** to optimise inference costs across **engineering** teams, working directly with Microsoft engineering to resolve **RBAC**, permissions, and **SDK integration** issues.

Senior DevOps Engineer, PwC

01/2023 – 08/2025 | London, UK

- Led the **Kubernetes** project for an **internal SaaS** platform: troubleshoot **pod logs**, authored **Helm charts** and templates, optimised **Dockerfiles** and image sizes, and reduced deployment errors by 15%.
- Built **Terraform** modules deploying multi-cloud infrastructure (**compute, networking, databases, AI services**) across **AWS, Azure**, and **GCP** with **DevSecOps** hardening (**Checkov, TFLint, Terratest, Anchore, SonarQube**), publishing reusable modules for multiple infrastructure use cases.
- Deployed Landing Zones in **AWS/Azure** with **Terraform**, shipping end-to-end **containerised applications** into client-managed environments with IP restrictions and environment isolation.
- Delivered into client cloud environments for **NatWest, Barclays**, and **Deutsche Bank**, configuring **EC2 auto-scaling groups** with placement groups for single-digit millisecond latency, **Azure VM Scale Sets**, and **CloudFront/Azure Front Door** for caching and latency reduction.
- Created **CI/CD pipelines** with **GitHub Actions** and **Azure DevOps** across 4–5 client projects with environment-specific variables, branch policies, **Python** linting, and PR automation.
- Implemented **API Management** for versioned endpoints and platform observability with Application Insights, tracking performance, usage, and latency metrics across 15+ deployed Azure services.
- Reduced user provisioning time by 25% through **Azure Entra ID, service principals**, and **GitHub** federation. Troubleshoot Container Apps and AWS ECS errors (404/503) using **CloudWatch, Log Analytics**, and **Azure Monitor**.

DevOps Engineer, Capgemini

02/2021 – 12/2022 | London, UK

- Built **serverless and containerised** applications using **AWS Lambda, API Gateway, Secrets Manager, Docker**, and **Kubernetes (EKS)**, improving performance and reducing operational costs by 25%.
- Enhanced deployment reliability and security by integrating **CI/CD pipelines (Azure DevOps, Jenkins, Drone CI, GitLab)** with **DevSecOps** tooling including **Anchore** and **SonarQube**.
- Supported cloud-hosted applications (**MoveIT, TeamMate**) by managing **UAT**, maintenance, and **infrastructure** coordination, deploying **Python/Flask** and Salesforce DX workloads with Terraform.

Projects

Azure LLM Deployment Automation – Enterprise AI Platform , Python, Azure CLI, Terraform

12/2025 – 01/2026

Modular Terraform architecture automating deployment of 50+ models with real-time quota discovery, capacity weighting, YAML configuration, and sequential dependency management across multiple resource families and SKUs.

GCP GenAI Application – Data Lineage for International Banks , GCP, Terraform, Docker

04/2025 – 08/2025

Deployed a Cloud Run application with reusable Terraform modules, Docker containerisation, and Cloud Armor security policies preventing unauthorised IP access.

AWS ECS Project – Personal Portfolio, AWS, ECS Fargate, Terraform, Python

07/2025

Authored AWS Terraform modules for Route 53, ALB, ECS Fargate, security groups, and VPC. Built architectural diagrams and deployed a containerised Flask application.

Certificates

Terraform Associate 

Azure Fundamentals 

AWS Certified Cloud Practitioner 

Education

BSc Communications and Media Studies, Brunel University of London

London
